Advances in surgical laser technology have permitted resection of diseased tissue in many medical procedures, and in particular, laser ablation, i.e., the use of laser radiation to cut tissue, has become increasingly popular in both open and endoscopic surgical procedures. In laser ablation procedures, laser energy is delivered to the target area from a laser beam directed to the area to be ablated. The laser beam is usually directed and manipulated by a surgical handpiece. Typically, the delivery of laser

radiation from the laser beam to the target area is effected by
